AAQ91121-Q91130 are nested PCR primers used for the amplification and identification of beta-cardiac myosin heavy-chain RNA. They are used in a new non-invasive method for diagnosing hypertrophic cardiomyopathy (HC), the method involves detecting the presence or absence of specific HC-associated mutations in the beta-cardiac myosin heavy-chain obtained from a blood sample. The method may be used to diagnose familial or sporadic HC and the non-invasive method is particularly important when testing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Non-invasive method for diagnosis of hypertrophic cardio-myopathy useful for testing asymptomatic individual(s).
                                                                                                                                                                                                                                                                                                                                                                                  chain; non-invasive; hypertrophic cardiomyopathy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Watkins H, Rosenzweig A;

The mutations associated with SHC/FHC are detected in the myosin gene isolated from blood, by detecting mis-matched areas in RNA-DNA hybrid double strands (RNA from the normal gene, DNA from the suspect asample). FHC associated point mutation can be classified and used to determine life expectancy in affected individuals e.g. using a Kaplan-Meier curve for the classified type of FHC causing point mutation. Also included are an RNA probe comprising ribonucleotides arranged in a sequence which is complementary to at least a portion of beta-cardiac myosin heavy-chain DNA and a set of DNA oligonucleotide primers for amplifying beta-cardiac myosin heavy-chain DNA comprising at least two
asymptomatic individuals suspected of having the disease. The method has a broad applicability and may be used to detect mutations responsible for other genetically inheritable diseases e.g. cystic fibrosis, Gaucher's disease, haemophilia A and B, Duchenne's muscular dystrophy, sickle cell anaemia, Tay-Sachs disease and phenylketonuria
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; ss; PCR; primer; beta cardiac myosin heavy chain; FHC; familial hypertrophic cardiomyopathy; SHC; Gaucher's disease; sporadic hypertrophic cardiomyopathy; life expectancy; haemophilia; buchenne's muscular dystrophy; sickle cell anaemia; Tay-Sachs disease; phenylketonuria; cystic fibrosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Detecting a presence or absence of a mutation associated with hypertrophic cardiomypathy, useful for diagnosing cystic fibrosis or hemophila, by detecting a mutation in an amplified product of a beta cardiac myosin heavy-chain DNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to detecting the presence or absence of a mutation associated with hypertrophic cardiomyopathy (familial or sporadic, FHC, SHC) for facilitating the diagnosis of hypertrophic cardiomyopathy, comprising amplified product, and detecting the presence or absence of a mutation associated with hypertrophic cardiomyopathy in the amplified product, thus, facilitating the diagnosis of hypertrophic cardiomyopathy. Also included are a set of DNA oligonuclectide primers for amplifying betacardiac myosin heavy-chain DNA comprising at least two oligonucleotides
             DNA. The method is useful for detecting the presence or absence of a mutation associated with hypertrophic cardiomyopathy. This method is sepecially useful for diagnosing SHC and FHC, as well as for determining the estimated the life expectancy of a person with familial hypertrophic cardiomyopathy. In particular, the method is useful for determining an individual's genetic information, and diagnosing e.g. Gaucher's disease, haemophilia, Duchenne's muscular dystrophy, sickle cell anaemia, Tay-Sachs disease, phenylketonuria or cystic fibrosis. The present sequence is a nested PCR primer used to amplify a region of the beta cardiac myosin heavy chain cDNA containing an FHC-associated mutation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Detecting mutations associated with hypertrophic cardiomyopathy to diagnose hypertrophic cardiomyopathy, comprises amplifying beta-cardiac myosin heavy-chain DNA and detecting the mutation in the amplified

cc which amplify beta-cardiac myosin heavy-chain DNA (the set of oligonucleotide primers being useful for facilitating the diagnosis of hypertrophic cardiomyopathy by being capable of detecting a hypertrophic cardiomyopathy and with for facilitating the diagnosis of hypertrophic cardiomyopathy (comprising a first container heavy chain DNA, where the RNA probe is capable of detecting a first container completely hybridisable to the beta-cardiac myosin heavy chain DNA, where the RNA probe is capable of detecting a hypertrophic cardiomyopathy-associated mutation, a second container container for amplifying beta-cardiac myosin heavy-chain DNA and instructions for using the components of the kit to detect the presence or absence of a hypertrophic cardiomyopathy-associated mutation in amplified beta-cardiac myosin heavy-chain DNA). The method is used for detecting the presence or absence of a mutation associated with chypertrophic cardiomyopathy for facilitating the diagnosis of individuals hypertrophic cardiomyopathy for facilitating the diagnosis of the theorem of clinical symptoms and the demonstration of unexplained ventricular cardiomyopathy relies on the presence of typical cardiomyopathy relies on the presence of typical clinical symptoms and the demonstration of unexplained ventricular contained by the present invention is non-invasive and based, at least in hypertrophy established that there are no extensive studies involving a large number of families which mutations in the beta cardiac myosin heavy-chain gene. Prior and contained by nother mutations in the beta cardiac myosin heavy-chain gene. Prior and contained by nother mutations in the beta cardiac myosin heavy-chain gene or dispersed the mutations in the beta cardiac myosin heavy-chain gene or dispersed the method of the presence o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            caused by point mutations in the beta cardiac myosin heavy-chain gene. The present sequence is a PCR primer used to amplify a region of the beta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  chain having a disease-related point mutation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 24 BP; 4 A; 9 C; 6 G; 5 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cardiac myosin heavy

Sequences ABZ43217-ABZ50887 represent polymorphic sites within genes encoding enzymes associated with drug metabolism. The invention relates to methods and compositions for identifying individuals who have at least one polymorphism in such drug metabolising enzyme-encoding genes. The polymorphisms may be identified in a nucleic acid sample using probes or primers specific for a sequence selected from ABZ4317-ABZ50887 using a variety of detection assays, including hybridisation assays, nucleic acid arrays and PCR-based methods. The invention also encompasses methods of arrays and screening drugs using genetic polymorphism data. Genetic polymorphisms (SNPs), may be used in studying the relationship between DNA sequence variations and human diseases, conditions, and responses to that cause or exacerbate certain diseases. SNPs are also useful as polymorphism markers for discovering genes that cause or exacerbate certain diseases. SNPs are particularly useful in the above respects as they are stable in populations, occur.
                                                                                                                                                                                                                                                                                                                                                                        Frequently, and have lower mutation rates than other genome variations such as repeating sequences. The detection and analysis of polymorphisms in genes encoding drug metabolising enzymes allows the customisation of drug therapies based upon the genetic profile of individual patients.

This would not only take the guesswork out of selecting the drug with the greatest therapeutic effect for a particular patient, but would also reduce the likelihood of adverse reactions, thereby increasing safety. Methods of the invention are also useful in the drug discovery and periods of the invention are also useful in the drug discovery and such of the invention are also useful in the drug discovery and capable of responding to a particular drug or drug class, and previously failed drug candidates could be revived if they were matched with more appropriate patient populations. The methods, data and compositions of the invention may therefore lead to a an increase in the range of possible drug targets and decreases in the number of adverse drug reactions, failed drug trials, the time taken for a drug to be approved, the length of time patient are on medication and the number of different may medications a patient needs to take before finding an effective therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; drug metabolising enzyme; gene; drug metabolism; chromosome 19; polymorphic site; drug evaluation; drug screening; genotyping; genetic profiling; therapeutic customisation; adverse reaction; clinical trial; drug approval; single nucleotide polymorphism; SNP; ds.

Conceining enzymes associated with drug metabolism. The invention relates encoding enzymes associated with drug metabolism. The invention relates conceining and compositions for identifying individuals who have at least to methods and compositions for identifying individuals who have at least cone polymorphisms may be identified in a mucleic acid sample using probes or primers specific for a sequence selected from ABZ4317-ABZ50887 using a variety of detection assays, including hybridisation assays, mucleic acid sample using probes or primers specific for a sequence selected from ABZ4317-ABZ50887 using a variety of detection assays, including hybridisation assays, mucleic acceptable drugs using genetic polymorphism data. Genetic polymorphism and screening drugs using genetic polymorphism data, particularly that relating the relationship between polymorphism (SMPS), may be used in studying the relationship between polymorphisms (SMPS), may be used in studying the relationship between polymorphisms (SMPS), may be used in studying the relationship between polymorphisms (SMPS), may be used in studying the relationship between the above respects as they are stable in populations, occur frequently, and have lower mutation rates than other genome variations in genes encoding drug metabolising enzymes allows the customisation of drug therapies based upon the genesic profile of individual patients.

This would not only take the guesswork out of selecting the drug with the greatest therapeutic effect for a particular patient, but would also reduce the likelihood of adverse reactions, thereby increasing safety.

This would not only if thair genetic profiles indicate that they are clinical trials only if thair genetic profiles indicate that they are capable of responding to a particular drug or drug class, and previouely familed drug tradstes and decreases in the number of adverse educe the liment populations. The embrance of adverse reactions, thereby individuals could be revived if they were matched or the particular and 
                                                                                                                                                                                                                      Identifying individuals having a polymorphism, useful for determining the effectiveness or side effect of a drug or treatment protocol, comprises detecting at least one polymorphism in the drug metabolizing enzyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CD1d complex; cytostatic; antiinflammatory; cancer; autoimmune disease;

The present invention relates to a compound comprising one or more CDId complexes and an antibody or its fragment specific for a cell surface marker. The CDId complexes comprise a CDId and a beta2-microglobulin molecule, and are linked to the antibody or its fragment. The composition and methods are useful for preventing or treating tumours and autoimmune/inflammatory or infectious diseases, such as multiple sclerosis, type I diabetes, ankylosing spondylitis, acute anterior uveitis, atrophic gastritis, ankylosing spondylitis, acute anterior uveitis, atrophic gastritis, ankylosing spondylitis, psoriatic arthitis, rheumatodiarthitis, systemic lupus erythematosus, systemic sclerosis, pemphigus vulgaris, pernicious anemia, primary biliary cirrhosis, ulcerative colitis or autoimmune hepatitis. The present sequence is a PCR primer used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CDId complex, cytostatic, antiinflammatory; cancer; autoimmune disease; inflammatory disease; immunosuppressive; antimicrobial; neuroprotective; antidiabetic; antiarthritic; antirheumatic; ophthalmological; gastrointestinal; nephrotropic; dermatological; hepatotropic; beta2-microglobulin; ss; primer; PCR.

The present invention relates to a compound comprising one or more CDId complexes and an antibody or its fragment specific for a cell surface marker. The CDId complexes comprise a CDId and a beta2-microglobulin molecule, and are linked to the antibody or its fragment. The composition and methods are useful for preventing or treating tumours and autoimmune/inflammatory or infectious disease, such as multiple sclerosis, type I diabetees, ankylosing spondylitis, acute anterior uveitis, atrophic gastritis, Goodpasture's syndrome, Grave's disease, Hashimoto's thyroiditis, myasthenia gravis, psoriasis, psoriatic arthritis, rheumatoid arthritis, systemic lupus erythematosus, systemic sclerosis, pemphigus vulgaris, pernicious anemia, primary biliary cirrhosis, ulcerative colitis or autoimmune hepatitis. The present sequence is a PCR primer used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CDId complex, cytostatic, antiinflammatory, cancer; autoimmune disease, inflammatory disease; immunosuppressive; antimicrobial; neuroprotective; antidiabetic; antiarthritic; antirheumatic; ophthalmological; gastrointestinal; nephrotropic; dermatological; hepatotropic; beta2-microglobulin; ss; primer; PCR.
                                                                                                                                                                                                                                                                                                                                           New compound comprising CD1d complexes and an antibody specific for a cell surface marker, useful for preventing or treating tumors and autoimmune/inflammatory or infectious diseases, e.g. multiple sclerosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a compound comprising one or more CDId complexes and an antibody or its fragment specific for a cell surface marker. The CDId complexes comprise a CDId and a beta2-microglobulin molecule, and are linked to the antibody or its fragment. The composition and methods are useful for preventing or treating tumours and autoimmunef/inflammatory or infectious diseases, such as multiple sclerosis, type I diabetes, anklylosing spondylitis, acute anterior uveitis, atrophic gastritis, Goodpasture's syndrome, Grave's disease, Hashimoto's thyroiditis, myasthenia gravis, psoriasis, psoriatic arthritis, systemic lupus erythematosus, systemic sclerosis, pemphigus vulgaris, pernicious anemia, primary biliary cirrhosis, ulcerative colltis or autoimmune hepatitis. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    drug activity monitoring; expression profile; gene expression; peripheral blood sample; peripheral blood mononuclear cell; drug therapy; CCI-779; immunosuppressant; rapamycin; mammalian target of rapamycin;
                                                                                                                                                                                                                                                                                                                                                                                                                                                              New compound comprising CDId complexes and an antibody specific for a cell surface marker, useful for preventing or treating tumors and autoimmune/inflammatory or infectious diseases, e.g. multiple sclerosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     sequence is a PCR primer used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

```
The invention relates to a method of monitoring drug activities in vivo by comparing an expression profile of at least one gene in a peripheral blood sample of a patient to a reference expression profile of the at least one gene is differentially expressed in peripheral blood mononuclear cells (PBMCs) of patients who have a non-blood disease and are subjected to a drug therapy as compared to PBMCs isolated from the patient before the drug therapy, and where the patient has the non-blood disease and is being treated by the drug therapy. The method, kit, and nucleic acid array are useful for monitoring drug cutivities in vivo. The drug is especially CCI-779, an ester analogue of the immunosuppressant rapamycin which is a potent inhibitor of the mammalian target of rapamycin (mTOR). This sequence represents a gene mammalian target of rapamycin (mTOR). This sequence represents a gene corporate in PBMC altered by the drug therapy. (Note: this sequence does no form part of the printed specification but was obtained in electronic format from WIPO at ftp.wipo.int/pub/published_pct_sequences/).
                                                                                                                                                                                                                                                                                                                                                               Monitoring drug activities in vivo comprises comparing an expression profile of a gene in a peripheral blood sample of a patient before and after drug therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    쉱
                                                                                                                                                                                                                                                                                                    ö
                                                                                              The invention relates to functional fragments of a leptin receptor, involved in suppressor of cytokine signalling 3 (SOCS3), cytokine-inducible SRL-Contraining protein (CIS) and/or Vav signalling. The leptin receptor functional fragments are useful for modulating ligand (e.g. leptin) induced signalling, and to screen compounds that interfere with the binding of the functional fragment with a signalling molecule e.g. Vav, SOCS3 or CIS. Modulators of leptin may be useful in food intake disorders and regulation of weight, angiogenesis, wound healing and susceptibility to digestive cancers. The present sequence represents a PCR primer for amplifying the murine CIS DNA fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention describes a novel recombinant transmembrane receptor comprising an extracellular ligand binding domain and a cytoplasmic domain that contains a heterologous bait polypeptide. The receptor is activated by binding of a ligand to the ligand binding domain and by binding of a prey polypeptide to the heterologous bait peptide. The receptor or the prey polypeptide is useful for detection of compound-compound binding, where the binding is modification state dependent and
                     New functional fragment of leptin receptor, involved in suppressor of cytokine signaling 3, cytokine-inducible SH2-containing protein and/or Vav signaling, useful for modulating ligand induced signaling.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New recombinant transmembrane receptor, useful for detecting compound-compound binding, comprises extracellular ligand binding domain and cytoplasmic domain containing heterologous bait polypeptide,.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention comprises a recombinant receptor which contains a ligand binding domain and a heterologous bait polypeptide. The activation of the receptor is inhibited by the binding of a prey polypeptide to the heterologous bait polypeptide. The recombinant receptor is useful for screening compounds that disrupt compound-compound binding - especially protein interactions that are essential to any biological process. The present DNA sequence represents a PCR primer that is used in the exemplification of the invention
the modification is phosphorylation, acetylation, acylation, methylation, ubiquitinilation or glycosylation. The binding is mediated by three or more partners, where one or more of the partners is not or not completely of proteinaceous nature. This sequence is one of 47 PCR primers (see ABK16683-ABK16729) associated with the construction of the recombinant transmembrane receptor, described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New recombinant receptor comprising a ligand binding domain and a domain that comprises a heterologous bait polypeptide, useful for screening compounds that disrupt compound-compound binding.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to the preparation of synthetic nucleic acid molecules which have altered transcriptional regulatory sequences compared to the wild-type. These sequences are then transcribed with less frequency compared to the wild-type. In particular, the invention relates to altered luciferase sequences. This can be used to detect weak promoter activity, to express fusion proteins, to detect and/or measure levels of gene expression, subcellular localisation or targeting, in life science research, agrogenetics, gene therapy, developmental science and pharmaceutical development. The present sequence is an oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                  transcriptional characteristics when expressed in a cell, for e.g making fusion proteins, by altering a wild type or another synthetic nucleic
                                                                                                                                                                                                                                                                                                                                                     a synthetic nucleic acid molecule with reduced inappropriate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   pharmaceutical development. The present sequence is an oligonucleotide described in the exemplification of the invention

consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and interferon alpha
The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRR-2 and/or the CAAT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and

PCR primers AAC62091-92 were used to amplify a human elastase I gene fragment. The elastase I gene maps to chromosome 12q13. Elastase is a serine protease, and is localised in the basal layer of the mammalian skin. The specification describes a mutant elastase I, with a frame shift mutation in any one of the codons 207-225. The mutation results in the disruption of the carboxy terminal of the protein, and possibly affects substrate binding. An allele encoding a mutant elastase I can be detected to determine the predisposition of a subject to a hyperproliferative skin condition (e.g. psoriasis, eczema, lupus erythmatosis and erythema) or
hyperproliferative skin condition such as psoriasis, eczema,

proteins, cytochromes, kinesins, cytokines, interferons, interleukins, G-protein coupled receptors and thioesterases. The present sequence is one such oligonucleotides and the peptides encoded by them oligonucleotides and the peptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of the proteins listed above. Disorders that may be prevented, diagnosed and/or treated include multifactorial diseases with a genetic component, such as autoimmune diseases (e.g. rheumatoid arthritis, multiple sclerosis, diabetes, systemic lugus erythromatosus and Grave's disease), inflammation, cancer leugamin, diseases of the nervous system and an infection of pathogenic

The present invention describes a compound (1) 8-50 nucleobases in length targeted to a nucleic acid molecule encoding SMRT (silencing mediator for retinoid and thyroid hormone action), where (1) specifically hybridises with the nucleic acid molecule encoding SMRT and inhibits expression of SMRT. (1) specifically hybridises with at least 8-nucleobase portion of a preferred target region on nucleic acid molecule encoding SMRT. Also caecribed is a composition (11) comprising (1) and a carrier or diluent. (1) and (11) have cytostatic, antiinflammatory, antiarthritic and antirheumatic activities, and can be used in antisense therapy, and as SMRT expression inhibitors. (1) is also useful for inhibiting the expression inhibitors. (1) is also useful for inhibiting an animal having a disease or condition associated with SMRT, e.g., inflammatory disorder such as rheumatoid arthritis, or a hyperproliferative disorder such as rheumatoid arthritis, or a hyperproliferative disorder such as research reagents and breast cancer, by inhibiting the expression of SMRT. (1) is useful for diagnostics, therapeutics, cypophylaxis and as research reagents and kits. The present sequence compliance is designated as SEQ ID NO:30 in cinhibits human SMRT, which is used in an example from the present cinvention. N. B. The present sequence is designated as SEQ ID NO:30 in example 15 but corresponds to SEQ ID NO:32 in the Sequence Listing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel antisense compound targeted to nucleic acid encoding SMRT (silencing mediator for retinoid and thyroid hormone action), useful for treating animal having disease associated with SMRT such as cancer, rheumatoid arthrits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SMRT; silencing mediator for retinoid and thyroid hormone action; SMRT inhibitor; cytostatic; antiinflammatory; antiarthrific; antirheumatic; antisense therapy; inflammatory disorder; rheumatoid arthriis; hyperproliferative disorder; cancer; leukaemia; breast cancer; human; ss; target.

The invention relate to a method of diagnosing (M1) non-blood disease such as solid tumor by providing peripheral blood sample of human having non-blood disease, and comparing an expression profile of specific genes in the peripheral blood sample to reference expression profile of the genes, where each of the genes is differentially expressed in peripheral blood ample to reference expression profile of the genes, where each of the genes is differentially expressed in peripheral compared to PBMCs of normal humans. The method is useful for diagnosing non-blood disease such as solid tumor. The solid tumor is chosen from compared to PBMCs of normal humans. The solid tumor is chosen from compared to ample comprises enriched PBMCs. The peripheral blood sample (claimed). (M1) is useful for identifying genes that are differentially expressed in peripheral blood samples is also another solid tumors. This sequence corresponds to a probe to detect a gene that is differentially expressed and detected by the method Diagnosing non-blood disease such as solid tumor, involves comparing differential expression profile of specific genes in peripheral blood sample of subject with reference expression profile of specific genes. PCR; amplification; primer; filamentous fungus; recombinant DNA; Recombinant filamentous fungus produced by gene conversion - has integrated into two or more mostly homologous DNA domains of its chromosomes, used in the fermentation industry. Length 25; Indels Sequence 25 BP; 6 A; 6 C; 8 G; 5 T; 0 U; 0 Other; Score 14.2; DB 12; Pred. AAV68288; Matches RESULT 22 AAV68288 à g targeted to a nucleic acid molecule encoding SMRT (silencing mediator for retinoid and thyroid hormone action), where (1) specifically hybridises with the nucleic acid molecule encoding SMRT and inhibits expression of SMRT. (1) specifically hybridises with at least 8-nucleobase portion of a preferred target region on nucleic acid molecule encoding SMRT. Also described is a composition (11) comprising (1) and acarrier or diluent. (1) and (11) have cytostatic, antiinflammatory, antiarthritic and antirheumatic activities, and can be used in antisense therapy, and as SMRT activities, and can be used in antisense therapy, and as SMRT in cells or tissues. (1) is useful for treating an animal cof SMRT in cells or tissues. (1) is useful for treating an animal having a disease or condition associated with SMRT, e.g., inflammatory composition as rheumatoid arthritis, or a hyperproliferative disorder such as rheumatoid arthritis, or a hyperproliferative disorder such as rheumatoid arthritis, or a hyperproliferative disorder such as research reagents and breast cancer, by inhibiting the expression of SMRT. (1) is useful for diagnostics, therapeutics, represente a human SMRT target region sequence is prophylaxis and as research reagents and kits. The present sequence represents a human SMRT target region sequence which is used in an example from the present invention. N. B. The present sequence is ö ss; diagnosis; non-blood disease; solid tumor; gene expression; peripheral blood mononuclear cell; renal cell carcinoma; prostate cancer; head/neck cancer; differential expression; probe. where the DNA domains are not the ribosomal DNA repeats. The recombinant fungus is used in the fermentation industry, and the DNA domains can be further multiplied with integrated recombinant DNA through gene conversion or amplification. The new fungi provide greater versatility compared with available systems, because the fungus is not confined to the use of deficient selectable marker genes for transformation, and is not confined to the use of only ribosomal DNA as target sequences for integration. Also, the fungi provide greater genetic stability of the integrated multiple copies compared with conventional recombinant fungilin which recombinant DNA are randomly integrated in tandem arrays. The genotype of the fungi can be completely defined, facilitating regulatory
                                                                                                                                                                                                                                                                                                                                                               approval, and the phenotype will be more predictable

៧ New human sodium-hydrogen exchanger like protein 1 (NHELP1), useful as passive replacement therapy or as a vaccine for treating or preventing disorders associated with aberrant expression or activity of human NHELP1.

Example 2; SEQ ID NO 3055; 468pp; English.

The invention relates to a nucleic acid molecule which encodes a Na+/H+ exchanger like protein (NHELP1). The NHELP1 nucleic acid molecule, NHELP1 polypeptide, an antibody against the protein or its antigen-binding fragment is useful in therapy. The NHELP1 nucleic acid molecule, NHELP1 polypeptide and an agonist are particularly useful for manufacturing a medicament for treating or preventing a disorder associated with decreased expression or activity of human NHELP1. The antibody or its antigen-binding fragment, and an antagonist, are useful for manufacturing a medicament for treating or preventing a disorder associated with increased expression or activity of human NHELP1. The NHELP1 nucleic acid or protein is useful as passive replacement therapy, as a vaccine, or in

for the T. gondii tachyzoite major surface antigen P30 (AAR57065). DNA fragment np30.873 encoding T. gondii antigen P30.291 was obtained by PCR amplification of a clone encoding the P30 gene using the primers given in AAQ70259-60. P30.291 comprises amino acids 46.336 of P30, but is functionally equivalent to the natural protein. Deletion of the Neterninal hydropholic region of P30 allows improved secretion from producer cells, for use in toxollasmosis vaccine production. (Updated on 25-WAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Use of packaging defective alpha-virus expression vectors - for prodn. of protective cpds. for protecting animals from disease, partic.

The present invention describes an INSP105 polypeptide comprising: (a) a composition acid sequence given in SEQ ID NO:8 (ADP71313); (b) a fragment common with (1); or (c) a functional equivalent of (1) or determinant in common with (1); or (c) a functional equivalent of (1) or (2). Also described: (1) a purified nucleic acid molecule which encodes the polypeptide; (2) a vector comprising the nucleic acid molecule; (3) a certifically to the growth hormone polypeptide; (5) a compound that specifically to the growth hormone polypeptide; (5) a compound that composition comprising the polypeptide; (7) a patient; (7) a pharmaceutical composition comprising the polypeptide; (8) a vaccine of composition comprising the polypeptide or nucleic acid molecule; (9) a composition comprising the polypeptide or nucleic acid molecule; (9) a composition comprising the polypeptide or nucleic acid molecule; (9) a composition comprising the polypeptide or nucleic acid molecule; (9) a composition comprising the polypeptide or nucleic acid molecule; (9) a composition comprising the polypeptide or nucleic acid molecule; (9) a composition disease in a patient; (11) a method for treating a disease; (13) a transgenic or knockout non-human comprisition and disease; (13) a transgenic or knockout non-human comprisition and disease; (13) a transgenic or knockout non-human comprotective, virucide, osteopathic, antibacterial, fungicide, conceptive, virucide, osteopathic, antibacterial, fungicide, anorectic, nephrotropic and cardiant activities. The INSP105 polypeptide or activity. The polypeptide, nucleic acid molecule, vector, host cell, is useful as a growth hormone or as a modulator of growth hormone or as a modulator of growth hormone or as a modulator of growth hormone or expression as a silver Russian expression and sector, disorders; preponenting a disease associated with growth and associated with 
neuroprotective; virucides osteopathic; antibacterial; fungicide; anorectic; nephrotropic; cardiant; reproductive disorder; pregnancy disorder; gestational trophoblastic disease; pregnancy disorder; gestational trophoblastic disease; growth disorder; gevel profiterative disorder; sliver-Russeals syndrome; growth disorder; growth hormone deficiency; Cushing's disease; endocrine disorder; cell proliferative disorder; neoplasm; carcinoma; tumour; melanoma; adenocarcinoma; choriocarcinoma; osteosarcoma; angiogenesis; myeloproliferative disorder; autoimmune disorder; inflammatory disorder; cardiovascular disorder; neurological disorder; pain; metabolic disorder; diabetes mellitus; osteoporosis; obesity; cachexia; AIDS; renal disease; lung injury; agging; infection; PCR; primer; ss; chromosome 17.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New INSP105 polypeptides, useful in preparing a composition for treating or preventing a disease associated with growth hormone proteins, e.g. cell proliferative, inflammatory or neurological disorders or infections.

The naturally occurring nucleic acids are composed of an alternative exon surrounded by seamlessly preceding and/or following nucleic acid sequences. The invention also claims an oligonucleotide probe for an alternatively splicing exon, the probe being complementary to a sequence comprising the exon sequence and flanking nucleic acids; and a series of probes, designed for a flanked exon nucleic acids; and a series of probes, designed for a flanked exon plognucleotide (FEO) array. The method is useful for designing of polymeric probes. The method is useful for obtaining detectable hybridisation levels between FEOs and alternative exons imbedded in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Designing of polymeric nucleic acid probes, useful for developing flanked exon oligonuclectide arrays used in expression profiling or for detecting the presence or expression levels of segments within genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                transcripts, when those alternative exons are of a length that does not ensure a reliable hybridisation, i.e. small exons. The method is especially designed for the detection of so-called small exons, i.e. fragments less than 70 base pair long and especially less than 40 base pair long. The method is useful for developing arrays of FEO used in expression profiling or other techniques aimed at detecting the presence or expression levels of segments within genes. The present sequence represents a symmetric FEO, a three exon oligonucleotide (THEO).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          88; flanked exon oligonucleotide; FEO; three exon oligonucleotide; THEO;
including viral infection, bacterial infection, fungal infection or parastic infection. The present sequence respresents a PCR primer for human INSP105, which is used in an example from the present invention. The human growth hormone-related gene family is located on chromosome

The invention relates to a novel method for designing polymeric nucleic acid probes whose sequence is complementary to naturally occurring to polymeric nucleic acids. The naturally occurring nucleic acids are composed of an alternative exon surrounded by seamlessly preceding and/or following nucleic acid sequences. The invention also claims and/or composed for an alternatively splicing exon, the probe being complementary to a sequence comprising the exon sequence and flanking nucleic acids; and a series of probes, designed for a flanked exon componentary to a sequence comprising the exon sequence and flanking nucleic acids; and a series of probes, designed for a flanked exon conjonucleotide (FEO) array. The method is useful for obtaining detectable hybridisation levels between FEOs and alternative exons imbedded in cranscripts, when those alternative exons are of a length that does not ensure a reliable hybridisation, i.e. small exons. The method is useful for developing and especially less than 40 base pair long. The method is useful for developing arrays of FEO used in expression profiling or other techniques aimed at detecting the presence or expression profiling or stream arrays of respectable for the designed and a fragments within genes. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ó

To mercinous and compositions for identifying individuals who have at least one polymorphisms may be identified in a nucleic acid sample using probes or primers specific for a sequence selected from ABZ43217-ABZ0887 using a craisety of detection assays, including hybridisation assays, nucleic acid arrays and PCR-based methods. The invention also encompasses methods of arrays and PCR-based methods. The invention also encompasses methods of callating and screening drugs using genetic polymorphism data, genetic polymorphism data, particularly that relating to single nucleotide polymorphisms (SNPs), may be used in studying the relationship between the superposed of arrays are also useful as polymorphism markers for discovering genes that cause or exacerbate certain diseases, conditions, and responses to drugs. SNPs are also useful as polymorphism markers for discovering genes that cause or exacerbate certain diseases. SNPs are particularly useful to frequently, and have lower mutation rates than other genome variations such as repeating sequences. The detection and analysis of polymorphisms to grud therapies based upon the genetic profile of individual patients. This would not only take the genetic loreling the drug with the greatest therapeutic effect for a particular patient, but would also reduce the likelihood of adverse reactions, thereby increasing safety. Methods of the invention are also useful in the drug discovery and approval processes. For example, individuals could be selected for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequences ABZ43217-ABZ50887 represent polymorphic sites within genes encoding enzymes associated with drug metabolism. The invention relates to methods and compositions for identifying individuals who have at least
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying individuals having a polymorphism, useful for determining th effectiveness or side effect of a drug or treatment protocol, comprises detecting at least one polymorphism in the drug metabolizing enzyme
                                                                                                                                                                                                                                                                                                         Human; drug metabolising enzyme; gene; drug metabolism; chromosome 12; polymorphic site; drug evaluation; drug screening; genotyping; genetic profiling; therapeutic customisation; adverse reaction; clinical trial; drug approval; ds.

ö
clinical trials only if their genetic profiles indicate that they are capable of responding to a particular drug or drug class, and previously failed drug candidates could be revived if they were matched with more appropriate patient populations. The methods, data and compositions of the invention may therefore lead to a an increase in the range of possible drug targets and decreases in the number of adverse drug reactions, failed drug trials, the time time for a drug to be approved, the length of time patients are on medication and the number of different medications a patient needs to take before finding an effective therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequences ABZ43217-ABZ50887 represent polymorphic sites within genes encoding enzymes associated with drug metabolism. The invention relates to methods and compositions for identifying individuals who have at least one polymorphism in such drug metabolising enzyme-encoding genes. The polymorphisms may be identified in a nucleic acid sample using probes or primers appecific for a sequence selected from ABZ43217-ABZ50897 using a variety of detection assays, including hybridisation assays, nucleic acid arrays and PCR-based methods. The invention also encompasses methods of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying individuals having a polymorphism, useful for determining the

constraining and screening drugs using genetic polymorphism data. Genetic polymorphisms data, particularly that relating to single nucleotide polymorphisms (SNPs), may be used in studying the relationship between DNA sequence variations and human diseases, conditions, and responses to drugs. SNPs are also useful as polymorphism markers for discovering genes that cause or exacerbate certain diseases. SNPs are particularly useful in the above respects as they are stable in populations, occur in the above respects as they are stable in populations, occur in the above respects as they are stable in populations occur in genes encoding drug metabolising enzymes allows the customisation of frequently, and have lower mutation rates than other genome variations in genes encoding drug metabolising enzymes allows the customisation of drug therapies based upon the genetic profile of individual patients.

This would not only take the guesswork out of selecting the drug with the companies therapeutic effect for a particular patient, but would also reduce the likelihood of adverse reactions, thereby increasing safety. Methods of the invention are also useful in the drug discovery and suppropriate patient populations. The methods, data and compositions of the invention may therefore lead to a mincrease in the range of the invention may therefore lead to a mincrease in the range of the invention may therefore lead to a mincrease in the range of the invention may therefore lead to a mincrease in the range of the invention may therefore lead to a mincrease in the approved, the length of time patients are on medication and the number of adverse drug creactions, failed drug trials, the time taken for a drug to be approved, the length of time patients are on medication and the number of different constraints a patient needs to take before finding an effective therapy

Amplifying expressed genetic sequences from genomic DNA of mammalian or higher order plant species for printing on DNA microarrays, involves using the 3' untranslated region of the gene sequence.

Disclosure; Page 6; 15pp; English.

The invention discloses a method for amplifying expressed genetic
sequences from genomic DNA (gDNA) from mammalian or higher order plant
species. The method involves identifying a 3' untranslated region (UTR)
of a gDNA sequence, designing probe, performing PCR, separating the
product by size differentiation and performing a second PCR to amplify
the predetermined sequence. Also claimed is a biological analysis device,
comprising a substrate and an array of a set of expressed genetic
sequences, located on the substrate, which are generated by the method
above and a DNA high-density microarray comprising a substrate upon which
cs are deposited an array of blosites of genomic DNA fragments having the
sequence of at least one exon, and absent polyadanine and vector
sequences, where the genomic DNA fragments have a sequence length of from
about 75-2000 nucleotides. The method is efficient for amplifying gene
sequences, enables large-scale production of DNA sequences, generates
crapped quantities of gDNA probes, which enables greater efficiency for
printing in microarray formats, fabricates high-density DNA arrays of
enhanced, widely varying genetic content and abstains from using RNAderived sequences by simple PCR amplifications without cloning. The
method produces amplified sequences that have greater specificity and
size consistency than that observed with cDNA fragments, and allows for
greater signal sensitivity than oligonoucloades. The sequence of
sa Type I gene specific primer which is linked at its 5' termini to the
construction producer.

```
The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the intitation codon, coding regain, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal alrawy dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an preventing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject, for reacting bronchoconstriction, lung allammation, lung allargies, or a respiratory disease or condition. Note: The sequence date for this patent is not represented in the printed a specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

This invention describes a novel composition (a) a first active agent, comprising oligomucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and bronchoconstriction, respiratory tract inflammation, allergies and bronchoconstriction, respiratory tract inflammation, allergies and creducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligomucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA.

The invention also describes a kit, that comprises: (a) adelivery device, in separate containers, (b) the oligomucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a consosition comprises oligo and is administered to reduce the production or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The cultural disease or conditions and/or bronchoconstriction and/or lung with a disease or conditions and/or bronchoconstriction, and/or bronchoconstriction and associated with a disease or conditions used and activity and an analymonary disease, pulmonary contransion, emphysema, chronic obstructions, and or surfactant hypoproduction, are associated with a disease or conditions present in the target RNA serves to prevent the breakdown of the range oligos corresponding to the infinite present in the target RNA serves to prevent the breakdown of the bronchiles or condens the prevent of prevent or prevent or introduced adenosine content of the reduced activity pr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it

The invention relates to methods of treating amyotrophic lateral sclerosis (ALS) or ALS-like symptoms that comprises inhibiting interleukin-1 converting enzyme (ICE) by gene therapy. A mutant ICE gene product can also be used for modulating programmed cell death accompanying ALS. Transgenic non-human animal (including progeny) containing a mutant ICE and SOD (ALS phenotype) gene are used to screen compounds for treating ALS. Inhibitors of an ICE-like caspase are used to cremate or prevent apoptosis resulting from traumatic brain injury (TBI), and to reduce the formation of reactive oxygen species following TBI. Diseases caused by acute and chronic disregulation of cell death, which are treated by the ICE gene product, include malignant and premalignant conditions, neurological, neurodegenerative disorders, heart disease, immune system disorders, intestinal disorders, kidney disease, disease, immune system disorders, intestinal disorders, kidney disease, aging, viral infections and acquired immune deficiency syndrome (AIDS). The methods, mutant genes and inhibitors of ICE enable a better understanding of the role of cell death and what triggers cell death in of the pathways mediating post traumatic apoptosis, which lead to novel pharmacotherapy of TBI. Sequences AMSOS223-27 represent PCR mutant property primers of mouse ICE cDNA used for constructing vectors containing mutant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; CAMP dependent kinase regulation subunit 8.8; cyclic AMP;
malignant tumour; inflammation; antagonist; reverse transcriptase PCR;
RT-PCR; primer; ss.
Treating amyotrophic lateral sclerosis (ALS) or ALS-like symptoms comprises inhibiting interleukin-1 converting enzyme (ICE) by gene therapy, useful for treating central nervous system damage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New human CAMP dependent protein kinase regulation subunit 8.8 polypeptide for treating diseases, such as, malignant tumors and inflammations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             57.5%; Score 13.8; DB 2; Length 25; 88.2%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a method of reducing glucosaminoglycan (GAG) content in a gilal scar by inhibiting the expression of primary proteoglycans or the expression and/or activity of a chain initiation or elongation enzyme. The method is useful in reducing GAG content in a gilal scar and promoting neuronal regeneration. This sequence corresponds to a fragment of the human X-II gene used to identify sequences to which antisense oligos, ribozymes, RNAi constructs can designed.
                                                                                                                                                                                                                                                                                                                                           expression

                                                                                                                                                                                                                           ó
                        The present invention discloses a new kind of polypeptide, human cAMP dependent kinase regulation subunit 8.8, polymorlectides encoding the polypeptide and a DNA recombination process to produce the polypeptide. The present invention also discloses applying the polypeptide in treating various diseases, such as malignant tumours, and inflammations. The present invention also discloses the antagonist resisting the polypeptide and its treatment effect. This sequence represents a PCR primer used to amplify DNA encoding the human cAMP dependent kinase regulation subunit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to a novel isolated polypeptide of human mitochondrial endomembrane transferase TIM 23 11.66, the polynucleotide encoding the protein and a method for producing the procedinant protein. The protein of the invention and the nucleic acid encoding the protein may be used in diagnosis and treatment of mitochondrial disease, tumours, developmental disorders, inflammation, and immune disorders by gene therapy. The invention also discloses an antagonist of the TIM23 protein and therapeutic uses thereof. The present sequence represents the human mitochondrial endomembrane transferase specific oligonucleotide probe #1. This probe is used to probe the mitochondrial endomembrane transferase.
                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention relates to a novel isolated polypeptide of human mitochondrial endomembrane transferase TIM 23 11.66, the polynucleotide encoding the protein and a method for producing the recombinant protein. The protein of the invention and the nucleic acid encoding the protein may be used in diagnosis and treatment of mitochondrial disease, tumours, developmental disorders, inflammation, and immune disorders by gene therapy. The invention also discloses an antagonist of the TIM23 protein and therapeutic uses thereof. The present sequence represents the human mitochondrial endomembrane transferase specific oligonucleotide probe #2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This probe is used to probe the mitochondrial endomembrane transferase cDNA of the invention

```
AA173060 to AA179867 represent isolated human polymorphic polymucleotide sequences (I), which contain single mucleotide polymorphisms (SNBs).

AAM53114 to AAM53329 represent peptides related to human polymorphic polymocleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polymeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of polymorphic polymeptides. For example, (I) may be used to treat disorders by rectifying mutations or deletions in a patient's genome that affect the activity of polymeptides by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (I) and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The polymorphic polypeptides. The antibodies may also be used as uniques. The antibodies may also be used as uniques. The antibodies may also be used acond the production of antibodies may also be used acond the production of antibodies may also be used acond the production of antibodies may also be used to down regulate expression and activity. The invention relates to a new compound, having a sequence targeted to a nucleic acid encoding BUBI-beta, which specifically hybridises with the nucleic acid encoding BUBI-beta and inhibits expression of BUBI-beta. The oligomucleotide compound is useful for preparing a composition for treating a hyperproliferative disorder, e.g. cancer. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

45 bp mRNA linear EST 01-MAR-1995 yc62e05.81 Stratagene liver (#937224) Homo sapiens CDNA clone IMAGE:85280 3' similar to gb:X02162 APOLIPOPROTEIN A-I PRECURSOR (HUMAD);, mRNA sequence.
                    T 3/1; double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Econed into the Not I and Eco RI sites of the modified pT/T3 vector. Library went through one round of normalization, and was constructed by Bento Soares and M.Fatima Bonaldo."
